

## EyePoppers: The Best Science Photos of the Week

Science labs across the world churn out the most startling images—maps of the human brain, cancer research that shows how molecules interact, DNA sequences that look like works of art. In just one gallery, you can see the latest findings in the world of science, told through pictures. These shots come from remote places—including a science lab in middle of the Indian Ocean, research institutions at major U.S. universities like Harvard and Cornell, and drug labs in Europe. ### Deep Water Mystery

This Hatchet fish, caught in the Indian Ocean on November 15, is a rare find. The fish has one of the longest daily migrations in the world, rising 700m to the surface each day and then descending to the depths again to digest.

"This animal comes from the twilight zone where there is still a low level of light but not visible to human eyes," says Sarah Gotheil, an [IUCN Global Marine Programme](#) researcher who spoke with us from the Indian Ocean. IUCN seeks to reveal deep water mysteries.
